Clinical growth charts reflect changes in the format of individual diagrams, resulting in two separate diagrams on one page and the added data entry tables. Clinical diagrams have grids scaled up to metric units (kg, see), with English units (lb, c) as a secondary scale. Clinical cards are available for boys and girls. Available clinical charts include: Infants, Births up to 36 months: Length for age and weight for age head circumference for age and weight for child and adolescent length, 2 to 20 years of height for age and weight for AGE FOR preschool children, 2 to 5 years clinical charts for infants and older children were published in two sets. Set 1 contains 10 charts (5 for boys and 5 for girls), with 5th, 10th, 25th, 50th, 75th, 90th and 95th smoothed interest lines for all charts, and 85th percentile for BMI-for-age and weight for growth. Set 2 contains 10 charts (5 for boys and 5 for girls), with 3rd, 10th, 25th, 50th, 75th, 90th and 97th smoothed interest lines for all charts and 85th percentile for BMI-for-age and weight-for-growth. Set 1 has external curves limits at 5 and 95 percent. These charts are what most users in the United States will find useful for most conventional clinical evaluations. Set 2 has external curves limits at 3 and 97 percent for selected applications. Pediatric endocrinologists and others who evaluate the growth of children with special health care requirements may wish to use the format in set 2 for individual applications. Two consolidated files are also available, each with all 10 clinical charts in set 1 or set 2. These consolidated files contain clinical diagrams from either set 1 or set 2 as described above. Babies (births up to 24 months) should be measured by length, and sex appropriate lengths for age or weight for chart length for infants, birth before 36 months should be used to build measurements. At the age of 24 months and older, if children can stand unaided and follow directions, growth should be measured and built on a growth chart for children (2 to 20 years). Otherwise, between 24 and 36 months, length can be used instead of growth. BMI-for-age charts are recommended to measure weight relative to height for children between the ages of 2 and 20. Weight charts for growth are available as an alternative to accommodate children aged 2-5 years who are not evaluated after preschool age. However, all health care providers should consider using a BMI for the age chart as required by current guidelines. All individual CDC 2000 growth charts have an initial publication date of May 30, 2000. For various reasons, changes were made to the charts after the original publication date. For example, individual were modified to create clinical maps that were available on October 16, 2000. Subsequent changes were made to the selected diagrams to correct or improve specific aspects of the scales on the charts. In all cases, the data points in the relevant data file for each modified chart remain the same as the original release on 30 May 2000. Where this is applicable, the date is indicated on each chart when the selected clinical maps are changed further. Clinical growth charts for growth for age have been changed because the inches scale has not been properly aligned with the metric scale. Clinical growth charts for infant lengths for age and infancy for age have been revised to improve the appearance of the scale for inches on the length charts, extending the scores by 1/2 inch in a step, and increasing the alignment of the English language with metric scales in both length and weight. Users should use the most recent versions of each chart as it is available on the growth charts website. To view, print, and play clinical growth charts, all clinical growth charts can be viewed, downloaded and printed in Adobe Acrobat. For regular viewing on a computer monitor and printing on a laser printer, individual diagrams are available as PDFs (black and white). All clinical diagrams have been colored for viewing and printing. When you go to the color printer, the clinical diagrams for boys will be printed in blue, and the clinical diagrams for girls will be printed in red. Otherwise, the same diagrams can be printed on a black and white printer. Higher-resolution PDF (color) files are available for the highest resolution and are intended to be used as a high-quality printing master to produce quantity when using commercial printing services. Recommended ink colors for print Pantone 206 red (for girls) and Pantone 286 blue (for boys). The recommended paper weight is 80 euros. Charts should be printed as two-sided copies, in the following combinations for each sex: Infants, birth to 36 months: Side 1: Length for age + Weight-for-age Side 2: Head circumference-for-age + Weight-for-length Children and adolescents, 2 to 20 years: Side 1: Stature-for-age + Weight-for-length Side 2: BMI-for-age or Weight-for-stature (age 2 to 5 years only) Set 1: Clinical charts with 5th and 95th percentiles Birth to 36 months (5th-95th percentile) Boys Length-for-age and Weight-for-age B&W Cdc-pdf[PDF – 41 KB] Modified 4/20/01 Color Cdc-pdf[PDF – 44 KB] Modified 4/20/01 Spanish Version, Color Cdc-pdf[PDF – 44 KB] Modified 4/20/01 French Version, Color Cdc-pdf[PDF – 44 KB] Modified 4/20/01 B&W Press-Ready Cdc-pdf[PDF – 186 KB] Modified 9/15/05 Color Press-Ready Cdc-pdf[PDF – 200 KB] Modified 9/15/05 Data table of Length-for-age charts Data table of Weight-for-age charts Boys Head circumference-for-age and Weight-for-length B&W Cdc-pdf[PDF – 48 KB] Modified 10/16/00 Color – 48 KB] Modified 10/16/00 Spanish Version Color Cdc-pdf[PDF – 52 KB] Modified 10/16/00 Французская версия Цвет Cdc-pdf -
